Facilitation Guide. Programming in Alice.  
( <https://www.alice.org/resources/lessons/programming-in-alice/> ) Summary. This facilitator guide is intended to guide the instructor through introducing the use of the Alice Code Editor for creating the program, or script for a story or game. This guide is intended to guide the facilitator through the introduction of the Alice built-in procedures, the fundamental building blocks of Alice programs.

Alice is a 3-D programming language that makes it easy to create an animation for creating applications, telling a story, or playing an interactive game. Alice is a teaching tool for introductory computing. It uses 3D graphics and a drag-and-drop interface to facilitate a more engaging, less frustrating first programming experience.

Alice is an innovative block-based programming environment that makes it easy to create animations, build interactive narratives, or program simple games in 3D. Unlike many of the puzzle-based coding applications Alice motivates learning through creative exploration. Alice is designed to teach logical and

A Computer Program is a set of instructions that tell the computer what to do. Think of computer programming not only as a way of telling a computer what you want it to do, but as a way of telling another human being what you want the computer to do. An elegant program is considered “elegant” if other human beings can easily

Syntax-directed editors are somewhat controversial, however I think they are quite good for people learning programming, and Alice was written first to be used in education in the school systems of Ontario.

The task of language engineering is to develop the technology for building computer systems which can perform useful linguistic tasks such as machine assisted translation, text retrieval, message classification and document summarisation. Such systems often require the use of a parser which can extract specific types of grammatical data from pre-defined classes of input text. There are many parsers already available for use in language engineering systems. However, many different linguistic formalisms and parsing algorithms are employed. Grammatical coverage varies, as does the nature of the syntactic information extracted. Direct comparison between systems is difficult because each is likely to have been evaluated using different test criteria. In this volume, eight different parsers are applied to the same task, that of analysing a set of sentences derived

from software instruction manuals. Each parser is presented in a separate chapter. Evaluation of performance is carried out using a standard set of criteria with the results being presented in a set of tables which have the same format for each system. Three additional chapters provide further analysis of the results as well as discussing possible approaches to the standardisation of parse tree data. Five parse trees are provided for each system in an appendix, allowing further direct comparison between systems by the reader. The book will be of interest to students, researchers and practitioners in the areas of computational linguistics, computer science, information retrieval, language engineering, linguistics and machine assisted translation.
