more integral to corporate operations at every level of the organization, the job of IT has expanded to become almost all-encompassing. These days, it's difficult to find corners of a company that technology does not touch. As a result, the need to plan for potential disruptions to technology services has increased exponentially. That is what Business Continuity Planning (BCP) is: a methodology used to create a plan for how an organization will recover after a disaster of various types. It takes into account both security and corporate risk management tactics. There is a lot of movement around this initiative in the industry: the British Standards Institute is releasing a new standard for BCP this year. In the devastation that follows a major disaster, there is a need for multiple sectors to unite and devote new resources to support the rebuilding of infrastructure, the provision of health and social services, the restoration of care delivery systems, and other critical recovery needs. In some cases, billions of dollars from public, private and charitable sources are invested to help communities recover. National rhetoric often characterizes these efforts as a "return to normal." But

for many American communities, pre-disaster conditions are far from optimal. Large segments of the U.S. population suffer from preventable health problems, experience inequitable access to services, and rely on overburdened health systems. A return to pre-event conditions in such cases may be short-sighted given the high costs - both economic and social - of poor health. Instead, it is important to understand that the disaster recovery process offers a series of unique and valuable opportunities to improve on the status quo. Capitalizing on these opportunities can advance the long-term health, resilience, and sustainability of communities - thereby better preparing them for future challenges. Healthy, Resilient, and Sustainable Communities After Disasters identifies and recommends recovery practices and novel

Fifth Edition programs most likely to impact overall community public health and contribute to resiliency for future incidents. This book makes the case that disaster recovery should be guided by a healthy community vision, where health considerations are integrated into all aspects of recovery planning before and after a disaster, and funding streams are leveraged in a coordinated manner and applied to health improvement priorities in order to meet human recovery needs and create healthy built and natural environments. The conceptual framework presented in *Healthy, Resilient, and Sustainable Communities After Disasters* lays the groundwork to achieve this goal and provides operational guidance for multiple sectors involved in community planning and disaster recovery. *Healthy, Resilient, and Sustainable Communities*

know where everyone is in a building by tagging them with an electronic badge.

The failure to plan for disaster recovery results in a process of rebuilding that often presages the next disaster. It also limits the collective maximization of governmental, nonprofit, and private resources, including those resources that are available at the community level. As individuals, groups, communities, and organizations routinely struggle to recover from disasters, they are beset by a duplication of efforts, poor interorganizational coordination, the development and implementation of policies that are not shaped by local needs, and the spread of misinformation. Yet investment in pre-event planning for post-disaster recovery remains low. Although

researchers pointed to this problem at least twenty-five years ago, an unfortunate reality remains: disaster recovery is the least understood aspect of emergency management among both scholars and practitioners. In addition, the body of knowledge that does exist has not been effectively disseminated to those who engage in disaster recovery activities. Planning for Post-Disaster Recovery blends what we know about disaster recovery from the research literature with an analysis of existing practice to uncover problems and recommend solutions. It is intended for hazard scholars, practitioners, and others who have not assimilated or acted upon the existing body of knowledge, or who are unexpectedly drawn into the recovery process following a disaster.
