Lieutenant-General Asim Munir was chief of Pakistan's two most influential intelligence agencies, the Inter-Services Intelligence (ISI) and the Military Intelligence (MI). However he held the ...

In this Research Note the author brings together the body of known work and presents many recent results relating to nonlinear partial differential equations that give rise to a free boundary--usually the boundary of the set where the solution vanishes identically. The formation of such a boundary depends on an adequate balance between two of the terms of the equation that represent the particular characteristics of the phenomenon under

consideration: diffusion, absorption, convection, evolution etc. These balances do not occur in the case of a linear equation or an arbitrary nonlinear equation. Their characterization is studied for several classes of nonlinear equations relating to applications such as chemical reactions, non-Newtonian fluids, flow through porous media and biological populations. In this first volume, the free boundary for nonlinear elliptic equations is discussed. A second volume dealing with parabolic and hyperbolic equations is in preparation.

This book is unique in bringing together the diverse concepts and ideas of meteorologists, atmospheric physicists and oceanographers into a single coherent account of the fluid environment, with emphasis on their physical properties and inter-dependence rather than on the mathematics. It provides an up-to-date appreciation of the subject area with reference to major research programmes in Oceanography and Meteorology, and an invaluable combined

perspective for undergraduates who tend to compartmentalise themselves. It also shows the way the subject is currently developing and suggests possible future research.

An introduction to the calculus, with an excellent balance between theory and technique. Integration is treated before differentiation -- this is a departure from most modern texts, but it is historically correct, and it is the best way to establish the true connection between the integral and the derivative. Proofs of all the important theorems are given, generally preceded by geometric or intuitive discussion. This Second Edition introduces the mean-value theorems and their applications earlier in the text, incorporates a treatment of linear algebra, and contains many new and easier exercises. As in the first edition, an interesting historical introduction precedes each important new concept.

The wars in Afghanistan and Iraq have highlighted again the precarious situation aid agencies find themselves in, caught as they are between the firing lines of the hostile parties, as they are trying to alleviate the plight of the civilian populations. This book offers an illuminating case study from a previous conflict, the Italo-Ethiopian war of 1935-36, and of the humanitarian operation of the Red Cross during this period. Based on fresh material from Red Cross and Italian military archives, the author examines highly controversial subjects such as the Italian bombings of Red Cross field hospitals, the treatment of Prisoners of War by the two belligerents; and the effects of Fascist Italy's massive use of poison gas against the Ethiopians. He shows how Mussolini and his ruthless regime, throughout the seven-month war, manipulated the International Committee of the Red Cross (ICRC) – the lead organization of

Get Free Marcellini Sbordone Isi 2

the Red Cross in times of war, helped by the surprising political naïveté of its board. During this war the ICRC redefined its role in a debate, which is fascinating not least because of its relevance to current events, about the nature of humanitarian action. The organization decided to concern itself exclusively with matters falling under the Geneva Conventions and to give priority to bringing relief over expressing protest. It was a decision that should have far-reaching consequences, particularly for the period of World War II and the fate of Jews in Nazi concentration camps.
