The issue of what defines project success (or failure) is complex and often elusive, and dependent on the perceptions of different stakeholders. In this enlightening book Emanuel Camilleri examines the key factors bearing on perceived success or failure. This book is not just about project management, it goes much deeper into the topic of project success by prescribing a project success framework. In chapters dedicated to factors such as leadership, teams, communication, information management and risk management, the author shines a light on the key behaviours in which project managers and others engage and how those behaviours predict success or failure. Practising project managers, project board members and sponsors, struggling to manage conflicting stakeholder expectations, complexity and ambiguity, will learn which factors are vital to determining successful outcomes. Finally, having highlighted the particular skills, abilities and attributes identified by the research, Dr Camilleri offers a diagnostic model for assessing an organization's preparedness for undertaking and successfully managing major projects. Project Success provides a valuable contribution to the literature on this subject, and its application delivers practical guidance that will be welcomed by project professionals at all levels.

Although much has been written about the process of managing projects, the field still lacks a full understanding of how critical factors contribute to the different stages of a project's life cycle. This paper examines a study testing the criticality of those success factors long believed to be instrumental to project success. It describes the study's two key findings and the three implications of these findings; it lists ten success factors most critical to project implementation and four critical areas that significantly impact project success. It also outlines the four-phase project life cycle--conceptualization, planning, execution, termination--used to conduct this study, explaining the purpose and function of each phase in relation to project implementation. It then discusses the study, an effort that involved randomly mailing one of three types of questionnaires to more than 600 PMI members. It reports on the response rate and the framework--the project implementation profile (PIP)--used to calculate the results. It lists the six characteristics used to measure project success and details the survey findings in relation to the four-phase project life cycle, identifying the key functions of--and project manager activities for--each phase. It outlines six activities that project managers should perform on all projects to ensure a successful outcome.

Information Technology (IT) projects have bigger contribution to the country economy and development. However, IT project management is a crucial task because many IT projects failed due to project delayed, over budget or not achieved the planned scope. The main objectives of this research are identifying critical success factors in IT projects and to investigate the challenges and effectiveness of the critical factors in IT projects. Meanwhile, this research also investigates the relationships between critical success factors and IT project success. A research framework with 7 critical success factors was developed based on the thorough literature review. These 7 factors are collected based on their importance to IT projects and their repeated occurrence in the literature related to the critical success factors. Surveying method has been used to collect data and the data collected are being analysed by using Statistical Package for the Social Sciences (SPSS) software. The respondents are selected from the IT companies that are located in Kuala Lumpur and Selangor with a Multimedia Super Corridor (MSC) status under the InfoTech group. This research is useful for IT companies where project managers can benefit from the mentioned critical success factors by concentration on them while planning and executing IT projects. From the results, it is observed that there are positive significance relationships between two (2) critical success factors and IT project success. Therefore, the results are significant to enhance the success rates of IT projects in Malaysia.

'International Project Management' provides specific guidelines for achieving greater project success. It is the result of 15 years of work on international projects by the authors across various project areas and industries. The authors address a need for modern techniques in project management geared and suited to international projects. They offer lessons learned from failures and problems in international projects, and suggest alternative solutions for project issues. Industry examples include manufacturing, distribution, communications, media, transportation, government, IT, marketing, energy, medical care, tourism, and others in forty countries across five continents. The purpose of this book is to answer: * What is an international project and why is it different? * What are the critical success factors for managing international projects? * How are vendors and outsourcing managed across national boundaries? * How do businesses effectively address cross- cultural, social, and political issues? * How are international communications set up and coordinated? * What should a manager look for in an international project leader? * How does a business select the right vendors for an international project? * How are inadequate or incompatible infrastructure and technology issues overcome? * How are the legal and bureaucratic limitations on project management dealt with?

This study presents exploratory work and seeks to identify and evaluate the success and failure factors that could form a guideline for further study and to some extent help professionals to understand some critical aspects that impact project performance concerning construction in India. A total of 55 attributes affecting the performance of construction projects are analysed in terms of their level of influence on four key performance criteria – schedule, cost, quality, and no disputes – using a two-stage questionnaire survey. These attributes are then further analysed, interpreted and evaluated. Based on the critical success factors obtained from the study, a neural network model-based predictive model for project performance has been developed. The performance prediction models have been derived for all four project performance criteria. Further, a hypothesis that 'project success' is influenced by 'success traits' has also been formulated. The hypothesized positive inter-relationships between success traits and project success have been tested using the structural equation modelling technique. Besides supporting the intuition of past researchers in recognizing 'coordination' as a key success factor, this study has revealed that coordination is not an isolated and independent activity, but is a typical management function with an inherent role in all major management activities. Key elements affecting coordination have also been identified and their influence on coordination effort has been studied. Furthermore, the present study has also identified three broad skill groups required of effective project coordinators. The results are validated through case studies of live projects and structured interviews with experts in the field of construction management.
