Moreover, each chapter follows a structured blueprint, so that multiple, essential items are not overlooked. Instead of simply concentrating on a limited number of extensive and pedantic coverages, scholarly diagrams are also included. Organizations spend large amounts of money to purchase, deploy and optimize their EHRs. They are not plug-n-play systems. This requires commitment to an ongoing improvement cycle that, when done well, responds to the people and process as well as the platform. When not done well, could result in complete failure of the system costing the organization thousands of dollars. In early 2014 the User Experience Team (UXP) at Dignity Health was invited to reorganize the Organization's EHR Governance. This request came on the heels of provider complaints about slow change request turn-around-time, low throughput and poor process transparency. At that time, approximately 60 change request were being released into the live environment on a quarterly basis and it was not uncommon for a change request to take over a year from the time it was submitted to the time it was finally seen by the end user within the EHR. This was compounded by a lack of tools for tracking a change request's lifecycle. This resulted in provider apathy and a pervasive sentiment that EHR Governance was a black hole. That core User Experience Team, who make up the author team for this book is comprised of key stakeholders who manage EHR governance processes end-to-end on a daily basis. Their foundational premise has always been that governance done right speeds up change and leads to a positive User Experience. This book is structured to be practical and pragmatic. It begins with how to finally see a clear vision to organizational leaders so they can champion strong EHR governance both theoretically and financially. The book concludes with a commitment to ongoing improvement and refinement - Governing Governance. Based on more than 5 years of ongoing refinement at Dignity Health (now CommonSpirit Health), this book shares processes that can scale to small and large organizations alike. It also calls out critical lessons learned to help the reader avoid the same mistakes and achieve measurable improvement more rapidly.

This textbook begins with an introduction to the US healthcare delivery system, its many systemic challenges and the prior efforts to develop and deploy informatics tools to help overcome those problems. It goes on to discuss health informatics from an historical perspective, its current state and its likely future state now that electronic health record systems are widely deployed, the HL7 Fast Healthcare Interoperability standard is being rapidly accepted as the means to access the data stored in those systems and analytics is increasing being used to gain new knowledge from that aggregated clinical data. It then turns to some of the important and evolving areas of informatics including population and public health, mHealth and big data and analytics. Use cases and case studies are used in all of these discussions to help readers connect the technologies to real world challenges. Effective use of informatics systems and their patients is key to improving the quality, safety and cost of healthcare. With health records now digital, no effective means has existed for sharing them with patients, among the multiple providers who may care for them and for important secondary uses such as public/population health and research. This problem is a topic of congressional discussion and is addressed by the 21st Century Cures Act of 2016 that mandates that electronic health record (EHR) systems offer a patient-facing API. HL7's Fast Healthcare Interoperability Resources (FHIR) is that API and this is the first comprehensive treatment of the technology and the many ways it is already being used. FHIR is based on web technologies and is thus a far more facile, easy to implement approach that is rapidly gaining acceptance. It is also the basis for a 'universal health app platform' that literally has the potential to foster innovation around the data in patient records similar to the app ecosystems smartphones created around the data they store. FHIR app stores have already been opened by Epic and Cerner, the two largest enterprise EHR vendors. Provider facing apps are already being explored to improve EHR usability and support personalized medicine. Medicare and the Veteran's Administration have announced FHIR app platforms for their patients. Apple's new iOS 11.3 features the ability for consumers to aggregate their health records on their iPhone using FHIR. Health insurance companies are exploring applications of FHIR to improve service and communication with their providers and patients. SureScripts, the national e-Prescribing network, is using FHIR to help doctors know if their patients are complying with prescriptions. This textbook is for introductory health informatics courses for computer science and health sciences students (e.g. doctors, nurses, PhDs), the current health informatics community, IT professionals interested in learning about the field and practicing healthcare providers. Though this textbook covers an important new technology, it is accessible to non-technical readers including healthcare providers, their patients or anyone interested in the use of healthcare data for improved care, public/population health or research.
