One of the most authoritative works in bacterial taxonomy, this resource has been extensively revised. In addition to the detailed treatments provided for all of the validly named and well-known species of prokaryotes, this edition includes new ecological information and more extensive introductory chapters.

This unique hands-on lab manual in child development provides great ideas and resources for teaching research courses involving child subjects. It includes projects in psychomotor/perceptual, cognitive, and social development. Projects are preceded by background essays on the history of that topic, related research, theoretical issues, and controversies. Each project has hypotheses to test, detailed procedures to follow, all stimuli, individual and group data sheets, empty tables, suggested statistics, discussion questions, and an updated bibliography. Special features of this second edition: *The introductory text portion details research considerations, including an introduction to psychological research, sections on developmental research, children as subjects, and general experimental research procedures. *The popular Infant Observation project has the student visit homes with babies for a semester and provides practice in observational data collection, reliability assessment, and report writing. *The cognitive development section includes two new subfields: Theory of Mind and Language--Children's Interpretation of the Word Big, in addition to classic studies of Piaget's spatial perspective-taking and attention and memory. The final chapter describes a suggested neuropsychological project. *The socialized child section includes a new study on sibling relationships as seen by the older or younger sibling, in addition to the earlier projects on self-esteem, sex identity, and cooperation-competition. The final section describes a suggested cross-cultural interview project.

The rapid acceptance of immunohistochemistry as an important and even indispensable adjunct to morphological examination and diagnosis requires the modern anatomical pathology laboratory to be conversant with, and proficient in, immunostaining procedures, as well as methods of tissue processing and antigen retrieval and the underlying characteristics of the increasing number of antibodies and antisera available. This fully revised, expanded and updated edition provides a comprehensive list of antisera and monoclonal antibodies that have useful diagnostic applications in tissue sections and cell preparations. Various clones, which are commercially available to detect the same antigen, are listed and the sensitivities and specificities of the antibodies are discussed. Importantly, the authors, all pathologists with a wealth of experience in immunostaining procedures, provide fully referenced details and expert advice on each reagent, with the reader will find invaluable. Finally, the appendices provide easily accessible and clear summaries of selected antibody panels for specific diagnostic situations, details of heat-induced antigen/epitope retrieval (including the use of microwaves) and a useful reference to the websites of the main antibody suppliers.
