Women and Health is a comprehensive reference that addresses health issues affecting women of all ages - from adolescence through maturity. It goes far beyond other books on this topic, which concentrate only on reproductive health, and has a truly international perspective. It covers key issues ranging from osteoporosis to breast cancer and other cancers, domestic violence, sexually transmitted diseases, occupational hazards, eating disorders, heart disease and other chronic illnesses, substance abuse, and societal and behavioral influences on health. In this second edition of Women and Health, chapters thoughtfully explore the current state of women's health and health care, including the influences of sex and gender on the occurrence of a wide variety of diseases and conditions. All chapters have been extensively updated and emphasize the epidemiology of the condition - the etiology, occurrence, primary and secondary prevention (screening), risk factors, surveillance, changing trends over time, and critical analysis of the diagnostic and treatment options and controversies. Treatment sections in each chapter have been expanded to create a stronger dialogue between epidemiologists and women's health practitioners. Saves researchers and clinicians time in quickly accessing the very latest details on a broad range of women's health issues, as opposed to searching through thousands of journal articles Provides a common language for epidemiologists, public health practitioners, and women's health specialists to discuss the behavioral, cultural, and biological determinants of women's health Researchers and medical specialists will learn how the gender-specific risks and features of one organ system's diseases affect the health of other organ systems For example: Hormone replacement therapy used to treat imbalance within the endocrine system is also being used to prevent and treat cardiovascular disease; Drugs developed for type 2 diabetes are now being used in chemoprevention Orient's the non-gerontologist about the importance of considering the entire life cycle of women within research designs and treatment plans Professors teaching courses in women's health will use slides and additional materials to structure lectures/courses; students will use slides as a unique resource to study for exams

"What is women's empowerment, and how and why does it matter for women's health? Despite the rise of a human rights-based approach to women's health and increasing awareness of the synergies between women's health and empowerment, a lack of consensus remains as to how to measure empowerment and successfully intervene in ways that improve health. Women's Empowerment and Global Health provides thirteen detailed, multidisciplinary case studies from across the globe and through the course of a woman's life to show how science and advocacy can be creatively merged to enhance the agency and status of women. Accompanying short videos provide background about programs on the ground in India, the United States, Mexico, Nicaragua, Zimbabwe, and South Africa. Women's Empowerment and Global Health explores the promises and limits of programmatic, scientific, and rights-based work in real-world settings and provides the next generation of researchers and practitioners, as well as students in global and public health, sociology, anthropology, women's studies, law, business, and medicine, with cutting edge and inspirational examples of programs that point the way toward achieving women's equality and fulfilling the right to health."--Provided by publisher.

Even though slightly over half of the U.S. population is female, medical research historically has neglected the health needs of women. However, over the past two decades, there have been major changes in government support of women's health research--in policies, regulations, and the organization of research efforts. To assess the impact of these changes, Congress directed the Department of Health and Human Services (HHS) to ask the IOM to examine what has been learned from that research and how well it has been put into practice as well as communicated to both providers and women. Women's Health Research finds that women's health research has contributed to significant progress over the past 20 years in lessening the burden of disease and reducing deaths from some conditions, while other conditions have seen only moderate change or even little or no change. Gaps remain, both in research areas and in the application of results to benefit women in general and across multiple population groups. Given the many and significant roles women play in our society, maintaining support for women's health research and enhancing its impact are not only in the interest of women, they are in the interest of us all.

'Globalization and Health' offers analysis of serious global threats to health, the tools that can be used to evaluate these, and the agencies established to respond to them. The dominant explanations of domestic violence, and the institutions to which battered women traditionally turn are challenged in this book. The final chapter deals with prevention suggesting ways in which male coercion will not be tolerated.

The evaluation of reproductive, maternal, newborn, and child health (RMNCH) by the Disease Control Priorities, Third Edition (DCP3) focuses on maternal conditions, childhood illness, and malnutrition. Specifically, the chapters address acute illness and undernutrition in children, principally under age 5. It also covers maternal mortality, morbidity, stillbirth, and influences to pregnancy and pre-pregnancy. Volume 3 focuses on developments since the publication of DCP2 and will also include the transition to older childhood, in particular, the overlap and commonality with the child development volume. The DCP3 evaluation of these conditions produced three key findings: 1. There is significant difficulty in measuring the burden of key conditions such as unintended pregnancy, unsafe abortion, nonsexually transmitted infections, infertility, and violence against women. 2. Investments in the continuum of care can have significant returns for improved and equitable access, health, poverty, and health systems. 3. There is a large difference in how RMNCH conditions affect different income groups; investments in RMNCH can lessen the disparity in terms of both health and financial risk.
